Olivander for Tradies

First Customer Build Spec - Two Plan Version

Purpose: define exactly what must be built, what the first customer sees, how they interact with it, and what changes between payment plans.

1. Product decision

Olivander should not launch as a full tradie job-management system. The first customer build should launch as an AI admin assistant for small trade businesses. It sits above the tools the business already uses, surfaces what needs attention, drafts the next admin action, and requires approval before anything customer-facing is sent.

Decision	Specification
Primary user	Owner-operator or 2-5 person trade business with no dedicated admin staff.
Starting trade fit	Electrician, plumber, HVAC, maintenance, or similar job-based service trade.
Core promise	Never lose admin work in the cracks: leads, replies, quote follow-ups, invoice reminders, and booking admin are prepared for approval.
Product shape	Mobile-first daily admin command centre with desktop support for setup and review.
Trust model	Approval-first. The system can draft and organise automatically, but does not send customer messages, alter invoices, or make calendar changes unless allowed.
First customer objective	Prove that one real tradie will use it weekly and value it enough to pay for admin relief, even before the product is fully automated.

2. Two payment plans

The first customer should be offered two clear plans. The cheaper plan proves the basic admin assistant value. The higher plan adds money, scheduling, and deeper workflow help. Do not create many tiers yet; choice paralysis will hurt sales.

Plan	Working name	Who it is for	Core promise	Suggested first-customer price
Plan 1	Olivander Admin Starter	Solo tradie or tiny team that mainly needs customer-message organisation and follow-up help.	Olivander finds leads, drafts replies, tracks jobs, and reminds the owner what needs attention.	NZD $49-$79 / month during first-customer validation.
Plan 2	Olivander Admin Plus	Tradie who wants more complete admin relief around quotes, invoices, calendar, and daily planning.	Olivander manages the daily admin queue: leads, replies, quote follow-ups, invoice reminders, bookings, and end-of-day summaries.	NZD $129-$199 / month during first-customer validation.

3. What is the same across both plans

- Both plans use the same core app shell: Today, Inbox, Jobs, Ask Olivander, Activity, and Settings.
- Both plans are approval-first by default. Nothing customer-facing is sent without explicit approval unless the user later changes rules.
- Both plans use plain-English action cards, not complex workflow-builder screens.
- Both plans include a visible AI activity log so the user can see what Olivander detected, drafted, changed, or ignored.
- Both plans support manual job creation, basic customer records, job timelines, draft replies, and lead capture from email/manual input.
- Both plans should feel practical, calm, reliable, and trade-specific rather than futuristic or overly technical.

4. What changes between plans

Feature area	Admin Starter	Admin Plus
Today dashboard	Shows leads, messages, jobs, and simple follow-ups.	Adds money-at-risk, quote pipeline value, invoice chasing, scheduling gaps, and richer recommendations.
Inbox triage	Classifies messages, detects new leads, drafts replies.	Also detects quote acceptance/rejection, reschedule requests, payment questions, and urgent/sensitive messages.
Jobs	Simple job cards and statuses.	Full job detail with quote/invoice sections, timeline, notes, files, and next-action suggestions.
Quote follow-up	Manual quote tracking and reminder cards.	Quote follow-up ladder with draft messages, potential value, days since sent, and suggested urgency.
Invoice chasing	Not included except manual notes.	Included: overdue invoice cards, reminder drafting, payment ladder, and money dashboard.
Calendar	View basic job date/time if entered manually.	Calendar integration, booking suggestions, schedule conflict warnings, daily plan.
Voice notes	Optional simple note capture if quick to build.	Voice note converts into job note, task, invoice prompt, or follow-up action.
Assistant	Can answer and create simple action cards from current app data.	Can run more advanced queries across jobs, quotes, invoices, calendar, and follow-up rules.
Automation rules	Basic approval-required drafting only.	Configurable low-risk rules later: quote follow-up timing, invoice reminder timing, booking reminders.
Reports	None beyond basic counts.	Simple business snapshot: unpaid money, overdue money, quotes waiting, jobs completed, admin actions completed.

5. First-customer shipping scope

This is the actual build target. It is intentionally smaller than the full platform vision. Anything outside this list should be treated as later unless the first customer explicitly needs it to pay.

Priority	Ship for first customer	Do not ship yet
P0 - must exist	Login, business setup, Today	Full accounting, native mobile app,

	dashboard, smart inbox, manual jobs, draft replies, approval workflow, activity log, settings.	team permissions, complex reporting, route optimisation.
P1 - likely needed	Quote follow-up tracking, simple money dashboard for Admin Plus, basic calendar awareness, customer profiles, mobile-friendly layout.	Tradify/Fergus integrations, WhatsApp, AI phone calls, advanced job costing.
P2 - only if fast	Voice note capture, file/photo upload, end-of-day summary, demo mode.	Customer portal, payment processing, compliance document management, full CRM campaigns.

6. Product feel requirements

Dimension	Requirement
Visual feel	Dark or light interface is acceptable, but it must feel simple, premium, and workmanlike. Avoid AI gimmick visuals. Use large cards, direct labels, clear status chips, and obvious action buttons.
Language	Use practical words: reply, quote, invoice, customer, job, follow up, approve, send, delay. Avoid agentic, workflow orchestration, LLM, automation graph, prompt, token, model.
Interaction style	The user should mostly approve, edit, delay, dismiss, call, or ask. Do not make them configure complex workflows to get value.
Trust	Every suggested action must show why it exists. Example: Quote sent 5 days ago and no customer response.
Speed	The product should feel fast enough for on-site use. Every high-frequency task should be possible in 1-3 taps after opening the relevant card.
Tone	Customer messages should sound like a capable local business, not corporate AI. Default to short, friendly, and practical.

7. Detailed feature requirements

7.1 Account, login, and workspace setup

Item	Build requirement
Purpose	Allow one trade business to create a workspace and configure basic business details before any AI features are used.
What the user sees	A short setup flow: business name, trade type, owner name, service area, normal work hours, payment terms, tone preference, and approval setting.
How the user interacts	The user signs in, enters business details, picks their plan, chooses tone, and lands on a setup checklist.
What the system does	Persist workspace settings, user profile, business rules, and plan entitlement. These values become defaults for message drafts, quote follow-ups, and invoice reminders.
Plan availability	Same for both plans. Admin Plus has extra setup fields for calendar, invoices, and follow-up timing.
Acceptance criteria	A new user can complete setup in under 7 minutes and reach the Today dashboard with at least one sample or

	imported action card.

7.2 Plan entitlement and billing logic

Item	Build requirement
Purpose	Make clear what the user has access to and prevent feature confusion between Admin Starter and Admin Plus.
What the user sees	A billing/settings page showing current plan, included features, unavailable locked features, and upgrade prompt.
How the user interacts	Starter users can see locked Plus features with a short explanation. Plus users see active money, calendar, and advanced follow-up features.
What the system does	Store plan state and gate features in the UI and backend. Do not simply hide everything; use some locked previews to explain value.
Plan availability	Different by plan. Starter excludes invoice chasing dashboard and calendar automation; Plus includes them.
Acceptance criteria	A Starter user cannot accidentally use Plus-only actions. A Plus user has all promised features available.

7.3 Today dashboard

Item	Build requirement
Purpose	Give the owner one place to see what needs attention today.
What the user sees	Top cards: Needs approval, New leads, Quote follow-ups, Jobs today, Activity. Plus also sees Money at risk and Calendar gaps.
How the user interacts	The user reviews action cards and clicks approve, edit, delay, dismiss, call, or open job.
What the system does	Aggregate inbox, jobs, quote follow-up rules, invoice status if Plus, and calendar data if Plus into priority-ranked action cards.
Plan availability	Same shell for both plans. Plus adds invoice, money, and calendar cards.
Acceptance criteria	At login, the user can identify the top 3 admin actions needing attention within 10 seconds.

7.4 Smart inbox

Item	Build requirement
Purpose	Turn messy customer messages into organised admin actions.
What the user sees	Inbox cards grouped by customer/job with category labels: New lead, Needs reply, Waiting on customer, Quote question, Booking request, Payment question, No action needed.
How the user interacts	The user opens a card, reads the original message, sees Olivander's interpretation, reviews the draft reply, and approves or edits it.
What the system does	Ingest connected email or manually entered messages. Classify intent, extract name/contact/job hints, detect whether a job exists, create suggested action and draft reply.
Plan availability	Starter includes core categories: new lead, needs reply, no action. Plus adds payment question, quote accepted/rejected, reschedule, urgency/sensitivity.

Acceptance criteria	At least 80% of common first-customer sample messages should be classified into a useful category; every AI classification can be corrected by user.

7.5 Lead capture

Item	Build requirement
Purpose	Capture new work opportunities before they are forgotten.
What the user sees	A New lead card with customer name, source, likely job type, missing info, and suggested reply.
How the user interacts	The user can create job, send reply, edit reply, dismiss, or call customer.
What the system does	Extract name, contact, job description, suburb/address if present, urgency, and missing fields from enquiry.
Plan availability	Same for both plans, with Plus adding richer missing-info prompts and scheduling suggestions.
Acceptance criteria	A user can convert a new enquiry into a job record in one click after reviewing details.

7.6 Draft reply generation

Item	Build requirement
Purpose	Save the user from writing repetitive customer replies.
What the user sees	Draft message box with tone controls: shorter, friendlier, more professional, firmer. Shows source context and reason for draft.
How the user interacts	The user approves, edits inline, regenerates tone, or dismisses.
What the system does	Generate drafts from message context, business tone settings, job status, and saved snippets. Store final sent/approved text in timeline.
Plan availability	Same for both plans. Plus gets more scenario-specific drafts for invoices, bookings, quote acceptance, and reschedules.
Acceptance criteria	Drafts should be short, specific, and not invent prices, dates, or promises not present in context.

7.7 Approval centre

Item	Build requirement
Purpose	Centralise everything waiting for user approval.
What the user sees	A queue grouped by action type: replies, quote follow-ups, invoice reminders, calendar changes, job updates.
How the user interacts	The user bulk-reviews low-risk items or opens each item. They can approve, edit, delay, dismiss, or mark as handled outside Olivander.
What the system does	Store pending actions with status and audit trail. Actions cannot execute until approved unless user enables a rule later.
Plan availability	Starter includes replies and quote follow-ups. Plus includes invoice reminders and calendar changes.
Acceptance criteria	No customer-facing send action occurs without an approval record in default mode.

7.8 Jobs pipeline

Item	Build requirement
Purpose	Give a simple view of work stages without becoming full project management software.
What the user sees	Kanban/list toggle with stages: New lead, Info needed, Quote sent, Waiting, Accepted, Scheduled, Completed, Invoiced, Paid, Lost.
How the user interacts	The user opens jobs, moves status, adds notes, creates follow-up, creates invoice prompt, or asks Olivander what is next.
What the system does	Store jobs, statuses, customer links, message links, due dates, next action, and timeline events.
Plan availability	Starter has simpler stages up to completed. Plus has invoiced/paid and calendar-linked scheduled stage.
Acceptance criteria	Every inbox lead can become a job, and every job has a visible next action or a clear no-action status.

7.9 Job detail page

Item	Build requirement
Purpose	Make one job the source of truth.
What the user sees	Header with customer, status, value if known, address, scheduled time, next action. Tabs: Summary, Messages, Notes, Quote, Invoice, Timeline.
How the user interacts	The user edits fields, adds note, uploads file if enabled, drafts reply, changes status, or asks for summary.
What the system does	Link all relevant messages, actions, approvals, quotes, invoices, notes, and calendar events to the job record.
Plan availability	Starter shows Summary/Messages/Notes/Timeline. Plus adds Quote/Invoice/Calendar deeper sections.
Acceptance criteria	A user can answer “what happened with this customer?” from the job page without searching email manually.

7.10 Customer profiles

Item	Build requirement
Purpose	Remember useful customer context across jobs.
What the user sees	Customer page with contact info, jobs, messages, invoices if Plus, notes, preferred contact method, and timeline.
How the user interacts	The user can update details, merge duplicates, add note, or open recent jobs.
What the system does	Create/merge customer records from inbox and job records. Avoid duplicate records where email/phone matches.
Plan availability	Same for both plans, Plus includes payment/invoice history if connected.
Acceptance criteria	A customer with multiple jobs shows all jobs and messages in one place.

7.11 Quote follow-up tracking

Item	Build requirement
Purpose	Stop quotes from being forgotten after they are sent.
What the user sees	Quote follow-up section showing customer, quote amount if known, sent date, days waiting, draft follow-up, and suggested timing.

How the user interacts	The user adds a quote manually or from a job, then approves follow-up drafts when due.
What the system does	Track sent date, follow-up cadence, status, value, customer response, and next follow-up date.
Plan availability	Starter includes manual tracking and basic reminders. Plus includes follow-up ladder, value-at-risk, and accepted/rejected detection.
Acceptance criteria	A quote can be marked sent, followed up, accepted, lost, or delayed; overdue follow-ups appear on Today dashboard.

7.12 Quote drafting - controlled version

Item	Build requirement
Purpose	Allow basic quote drafts without pretending to be a full pricing engine.
What the user sees	A quote draft page with line items, assumptions, exclusions, GST toggle, expiry, and customer message.
How the user interacts	The user enters prices or selects saved items. Olivander formats and writes the customer-facing explanation.
What the system does	Generate structure and wording only unless saved rates or user inputs provide numbers. Flag missing price information.
Plan availability	Plus only for first customer unless Starter user manually types all fields; avoid promising advanced quote automation in Starter.
Acceptance criteria	The system never invents material or labour pricing. Missing prices are shown as missing, not guessed.

7.13 Money dashboard

Item	Build requirement
Purpose	Show where cash is stuck and what needs action.
What the user sees	Cards: Overdue, Due soon, Draft invoices, Completed not invoiced, Paid recently. Each card has actions.
How the user interacts	The user reviews invoice reminder drafts, marks paid, delays chasing, or opens customer/job.
What the system does	Pull invoice state from manual entries or Xero later. Calculate overdue days and reminder stage.
Plan availability	Plus only. Starter may see locked preview or simple manual notes but not full money dashboard.
Acceptance criteria	Plus user can see total overdue, due soon, and reminders ready without opening Xero manually.

7.14 Invoice reminder drafting

Item	Build requirement
Purpose	Make payment chasing easier and less awkward.
What the user sees	Invoice card with amount, due date, days overdue, reminder tone, and draft message.
How the user interacts	The user sends, edits, makes firmer, delays, marks paid, or stops chasing.
What the system does	Generate staged reminder drafts based on days overdue, prior reminders, customer tone, and business payment terms.
Plan availability	Plus only.
Acceptance criteria	Reminder messages must be polite, accurate, and never

	threaten legal/debt action unless user explicitly selects a final notice template.

7.15 Calendar-aware scheduling

Item	Build requirement
Purpose	Reduce back-and-forth booking messages.
What the user sees	When a customer asks for a time, Olivander suggests available slots and drafts reply.
How the user interacts	The user approves suggested times, books job, reschedules, or overrides manually.
What the system does	Read calendar availability, business hours, job duration estimate, and travel buffer if configured. Create pending calendar actions.
Plan availability	Plus only for integrated scheduling. Starter can store manual dates/times on jobs.
Acceptance criteria	Plus user can offer available times from a customer message without manually checking calendar.

7.16 Jobs today

Item	Build requirement
Purpose	Keep the user oriented on the day's work.
What the user sees	List of today's scheduled jobs with time, customer, address, job type, missing info, and quick actions.
How the user interacts	The user sends ETA, opens map/address, marks complete, adds note, or creates invoice prompt.
What the system does	Use job date/time and calendar events to create daily schedule cards. Flag missing address or customer confirmation.
Plan availability	Starter supports manually entered jobs. Plus pulls from calendar integration and adds ETA/booking suggestions.
Acceptance criteria	Opening Today shows every job planned for the day and any missing critical info.

7.17 Voice note capture

Item	Build requirement
Purpose	Let the tradie capture admin while on-site or in the van.
What the user sees	Big mobile button: Add voice note. After recording, user sees extracted job note, tasks, invoice prompt, and follow-up suggestions.
How the user interacts	The user records, reviews extracted items, accepts them, edits them, or discards.
What the system does	Transcribe audio, summarise into structured fields, link to job/customer, and propose next actions.
Plan availability	Prefer Plus for first version. Starter can have text notes only unless voice is cheap to implement.
Acceptance criteria	A 20-second note can become a saved job note and at least one suggested task without manual typing.

7.18 End-of-day summary

Item	Build requirement
Purpose	Stop admin accumulating after the workday.
What the user sees	Summary card: jobs completed, invoices to draft,

	messages sent, follow-ups due tomorrow, unresolved items.
How the user interacts	The user reviews, approves pending drafts, moves tasks to tomorrow, or asks for a summary.
What the system does	Aggregate day activity, job statuses, approvals, and unresolved cards into a short report.
Plan availability	Plus for full version. Starter can have simple daily activity summary.
Acceptance criteria	At day end, the user can see what remains unresolved and what Olivander prepared.

7.19 Activity log

Item	Build requirement
Purpose	Make AI behaviour visible and auditable.
What the user sees	Timeline entries such as detected lead, drafted reply, user approved, message sent, job created, invoice flagged.
How the user interacts	The user filters by job/customer/action type and opens linked records.
What the system does	Log every detection, draft, approval, send, status change, dismissal, and integration sync result.
Plan availability	Same for both plans. Plus logs more action types.
Acceptance criteria	Every AI suggestion and executed action has a timestamped record.

7.20 Settings and business rules

Item	Build requirement
Purpose	Let the user make Olivander match their business without complex configuration.
What the user sees	Settings pages: Business, Tone, Services/Rates, Approval Rules, Follow-up Timing, Integrations, Plan.
How the user interacts	The user sets defaults using plain forms and toggles.
What the system does	Persist settings and apply them to drafts, follow-ups, invoices, scheduling, and dashboard prioritisation.
Plan availability	Starter has basic business/tone/approval settings. Plus adds rates, payment terms, follow-up ladders, calendar, invoice rules.
Acceptance criteria	Changing a setting affects future generated drafts and recommendations.

7.21 Demo/sample data mode

Item	Build requirement
Purpose	Allow selling and onboarding before the customer connects real accounts.
What the user sees	A sample workspace with fake customers, leads, overdue invoices, quote follow-ups, and activity.
How the user interacts	The user clicks through realistic cards and approves sample actions.
What the system does	Seed demo records and disable real sends. Label demo mode clearly.
Plan availability	Same for both plans; useful before payment and setup.
Acceptance criteria	A prospect can understand the product in under 3 minutes without connecting Gmail/Xero.

8. First-customer user journeys

New lead arrives

1. Customer sends enquiry by email or user enters it manually.
2. Olivander creates New lead card with missing info and draft reply.
3. User reviews draft, edits if needed, approves.
4. Olivander creates job and timeline entry.
5. Job appears in Jobs pipeline and Today if follow-up required.

Quote follow-up

6. User marks quote as sent or Olivander detects sent quote.
7. After follow-up period, Today shows Quote needs follow-up.
8. Olivander drafts short follow-up message.
9. User approves, edits, delays, or marks lost.
10. Job timeline records outcome and next follow-up date.

Invoice reminder - Plus

11. Invoice is manually entered or pulled from Xero later.
12. Due date passes without payment.
13. Money dashboard and Today show overdue invoice.
14. Olivander drafts reminder based on overdue stage.
15. User approves or edits; activity log records reminder.

Booking request - Plus

16. Customer asks for time availability.
17. Olivander checks calendar and business hours.
18. It suggests 2-3 available slots and drafts reply.
19. User approves.
20. After customer confirms, Olivander creates/updates job schedule and logs it.

End-of-day - Plus

21. User finishes jobs and records notes.
22. Olivander detects completed jobs without invoice or follow-up.
23. End-of-day summary shows unresolved admin.
24. User approves invoice prompts/follow-ups or moves them to tomorrow.

9. First-customer build order

Build phase	Scope	Done when
Phase 1 - App shell	Auth, workspace, sidebar/nav, Today, Inbox, Jobs, Ask, Activity, Settings, plan gating.	User can log in, set up workspace, view sample data, and navigate all core screens.
Phase 2 - Manual data + demo mode	Manual lead/job/customer creation, sample dataset, action cards, activity log.	Product can be demoed without external integrations.
Phase 3 - Smart inbox MVP	Email/manual message ingestion, classification, draft replies, approval centre.	A real or pasted customer message becomes a lead/reply card with a useful draft.
Phase 4 - Quote follow-ups	Quote sent tracking, follow-up timing, draft follow-up messages, dashboard cards.	User can track quotes and get follow-up reminders.
Phase 5 - Plus money/calendar	Manual invoice tracking, invoice	Plus user can see overdue money

	reminders, basic calendar availability, booking suggestions.	and scheduling suggestions.
Phase 6 - Polish for first customer	Mobile responsiveness, empty states, error states, onboarding copy, locked feature previews, feedback buttons.	First customer can use it for a week without founder hand-holding every session.

10. Explicit non-goals for first customer

- Do not build a full accounting system. Use simple invoice records first; integrate Xero only when needed for validation.
- Do not build a full job-costing engine. Quote drafting should format and organise, not calculate complex margins.
- Do not build route optimisation. Calendar awareness is enough for first customer.
- Do not build native iOS/Android apps. Build responsive web first.
- Do not build WhatsApp/SMS unless first customer refuses to use email/manual entry without it.
- Do not build a custom automation workflow builder. Use simple rules and approval cards.
- Do not overbuild analytics. The main dashboard is action-first, not chart-first.

11. Acceptance test checklist

Test	Expected result
Can a new user understand the product?	From demo mode, they can explain that Olivander finds admin actions and drafts them for approval.
Can a lead become a job?	A message can be turned into a customer and job with a timeline entry.
Can a reply be drafted and approved?	Draft appears with reason, user edits/approves, activity log records action.
Can quotes be followed up?	Quote sent date creates a follow-up card when due with a draft message.
Can Plus chase invoices?	Overdue invoice appears in Money and Today with reminder draft and status controls.
Can Plus help schedule?	Booking request produces available time suggestions or a clear reason availability is unknown.
Is AI behaviour visible?	Every detection, draft, approval, send, status change, and dismissal appears in Activity.
Is the product mobile-usable?	Core actions - review, approve, edit, delay, open job - work cleanly on phone width.
Are plan differences clear?	Starter user understands what they have and what Plus unlocks without being blocked by confusing missing buttons.

12. Final first-customer offer

The first customer should not be sold a giant AI platform. They should be sold a practical admin relief system with a controlled pilot.

Offer element	Admin Starter	Admin Plus
Positioning	Olivander organises your leads, replies, jobs, and quote follow-ups.	Olivander runs your daily admin queue: replies, follow-ups, invoices, scheduling, and daily planning.
Best buyer	Solo tradie testing whether AI admin help is useful.	Busy tradie with real follow-up, payment, and scheduling pain.
Founder onboarding	30-45 minute setup call.	60-90 minute setup call with business rules, payment terms, and workflow

		configuration.
Success metric	Fewer missed leads and faster replies.	Fewer missed leads, more quote follow-ups, faster invoice chasing, clearer daily admin.
Pilot promise	We will help you stay on top of customer admin.	We will help you stay on top of customer admin and money follow-up.

The build should be judged by one ruthless question: does the first customer come back because Olivander shows them useful admin work they would otherwise forget or delay? If yes, continue. If no, cut features and sharpen the wedge.
